### FAQs

#### ➤ What is memory?

Memory is the main place where your computer stores and reads information while it is running. That's part of the OS and software you're running and also data he's working with.

#### ➤ Why it is so important?

Memory is important because it's what keeps your computer running quickly. When you have a lot of programs running, which may consume all your memory, then your computer has to use your hard disk for memory. Because hard disks are almost a hundred times slower than memory, your computer slows to a crawl when it runs out of memory. It also often becomes unstable.

#### ➤ Can Power Memory Booster make my system unstable?

No. If anything, because it increases the amount of memory available to applications, your system should become more stable. It does not modify your system files in any way.

#### ➤ Defragment

Under Power Memory Booster, you can specify the free memory level that triggers automatic optimization, and how much memory you want to free up.

#### ➤ Manual Optimization

**A:** Under Clipboard, the module shows the current amount of memory occupied by the data in your clipboard. Click clean Clipboard to free up the memory used by this data.

**B:** You can adjust the amount of memory to free-up in 1MB steps by using the appropriate slider

#### ➤ Fast free and deep compress

**A:** To Clean up your memory rapidly, click

A rectangular button with a gradient from light orange to yellow, containing the text "Fast Free" in blue.

**B:** To Compress your memory deeply, click

A rectangular button with a gradient from light orange to yellow, containing the text "Deep Compress" in blue.
